

Contributor Dataset QA Guide

Page: <http://localhost:3000/contributor/dataset-qa>

Goal

Check that each dataset question is accurate before it is used for student exam practice.

Review flow

1. Select the past exam, such as 2025 Mathematical Methods Exam 1.
2. Enter your reviewer name before saving any decision.
3. Choose a question from the QA queue.
4. Read the rendered question and compare it with the source if needed.
5. Check topic, subtopic, marks, answer type, answers, solution, and rubric.
6. Paste the expected answer into the answer test box and run the marker.
7. Edit fields only when you can clearly identify the issue.
8. Add reviewer notes explaining what you checked or what needs fixing.
9. Choose a QA decision and save.

QA decisions

Ready for QA: not reviewed yet.

Approved: question, answer, solution, topic mapping, and marking behavior look correct.

Needs Fix: something is wrong but repairable.

Rejected: record is unusable or too broken to repair safely.

Manual Review: keep the question, but do not rely on machine marking.

Golden example: Question 3a

Question: open Question 3a from 2025 Mathematical Methods Exam 1.

Source check: rendered question asks for the range of $f(x)=2\cos(2x)+1$ on $[0, 2\pi]$.

Topic check: topic is trigonometric/circular functions; subtopic is trigonometric graphs.

Answer check: expected answer is $[-1,3]$.

Marker check: paste $[-1,3]$ into the answer test box. It should return Correct, 1 / 1.

Solution check: worked solution explains $-1 \leq \cos(2x) \leq 1$, so $-1 \leq f(x) \leq 3$.

Decision: choose Approved.

Reviewer notes: Approved. Question text matches source. Expected answer $[-1,3]$ returns 1/1.

If the marker returns incorrect for the copied expected answer, choose Needs Fix.

What to check

Question markdown: rendered question matches the source exam.

Topic/subtopic: labels make sense for Cambridge/VCE Math Methods.

Correct answer: mathematically correct and exact where required.

Accepted answers: useful equivalent forms are included.

Worked solution: explanation matches the marking guide.

Marking rubric: marks add up and criteria are clear.

Answer test: copying expected answer should mark correct when machine-markable.

Manual review questions

Graph, proof, sketch, and explanation questions may be marked Manual Review.

Do not force auto-marking. Check that answer, rubric, and solution support human review.

Reviewer note examples

Approved. Expected answer copied into marker returns full marks.

Needs fix. Topic should be trigonometric graphs, not differentiation.

Manual review. Graph sketch requires human marking. Rubric is acceptable.

Rejected. Question extraction is missing the diagram.
